

ABSTRACT OF THE DISCLOSURE

The invention enables to readily download device control software to control device.

Once receiving a request from a client PC through a HTTP communication
5 module 10, a printer PT identifies an OS used by the client PC from an
environment variable attached to the request through an OS identification
module 11. A driver location search module 11 searches a location address
of a printer driver corresponding to the identified OS from a driver location
database 12. A HTML generation module 14 generates a Web page in which
10 a link to this location address is described and then informs the client PC of
it as response via the HTTP communication module 10.
